during the last two decades structural equation modeling sem has emerged as a powerful multivariate data analysis tool in

social science research settings especially in the fields of sociology psychology and education although its roots can be traced back to the first half of this century when spearman 1904 developed factor analysis and wright 1934 introduced path analysis it was not until the 1970s that the works by karl joreskog and his associates e g joreskog 1977 joreskog and van thillo 1973 began to make general sem techniques accessible to the social and behavioral science research communities today with the development and increasing availability of sem computer programs sem has become a well established and respected data analysis method incorporating many of the traditional analysis techniques as special cases state of the art sem software packages such as lisrel joreskog and sorbom 1993a b and eqs bentler 1993 bentler and wu 1993 handle a variety of ordinary least squares regression designs as well as complex structural equation models involving variables with arbitrary distributions unfortunately many students and researchers hesitate to use sem methods perhaps due to the somewhat complex underlying statistical representation and theory in my opinion social science students and researchers can benefit greatly from acquiring knowledge and skills in sem since the methods applied appropriately can provide a bridge between the theoretical and empirical aspects of behavioral research

written for use in the first course of a typical chemical engineering program material balances for chemical reacting systems introduces and teaches students a rigorous approach to solving the types of macroscopic balance problems they will encounter as chemical engineers this first course is generally taken after students have completed their studies of calculus and vector analysis and these subjects are employed throughout this text since courses on ordinary differential equations and linear algebra are often taken simultaneously with the first chemical engineering course these subjects are introduced as needed teaches readers the fundamental concepts associated with macroscopic balance analysis of multicomponent reacting systems offers a novel and scientifically correct approach to handling chemical reactions includes an introductory approach to

chemical kinetics features many worked out problems beginning with those that can be solved by hand and ending with those that benefit from the use of computer software this textbook is aimed at undergraduate chemical engineering students but can be used as a reference for graduate students and professional chemical engineers as well as readers from environmental engineering and bioengineering the text features a solutions manual with detailed solutions for all problems as well as powerpoint lecture slides available to adopting professors

the book will present materials researchers and users with a wealth of new information covering the entire spectrum of ecology eco materials nano materials bio materials recycling environmental protection and energy conversion related materials it is divided into seven sections the first deals with photocatalysts for air pollution water pollution deodorizing self cleaning power light sources and the standardization of methodologies in photocatalytic reactivity the second section covers the incorporation of end of life strategies into materials design as well as biomaterials the third section covers the use of non hazardous components as substitutes for traditional but hazardous components the fourth section covers the treatment of waste materials and the fifth section describes manufacturing via the using of more environmentally friendly processing eco processing and eco materials design the final section covers energy related or energy conversion related materials such as hydrogen energy fuel cells and batteries a book not to be missed
